

## Team Duemila

Team Duemila operates successfully in the Information Technology sector, particularly in the tanning Industry, where it's the market leader with its ERP software **Xtannery**, a management solution for Windows that's employed by numerous and important companies in all the major Italian and European tanning districts.

**Xtannery** is the result of over twenty years of continuous investment, during which we have always been proactive in creating solutions that not only meet the demands of our customers but also use the latest technology.

In the current economic context, where tanning companies must regain competitiveness through investments in new technologies, in order to improve and streamline business activities, **Xtannery** can be an excellent tool for business control.

Constantly expanding and perfecting the products and services offered to its customers, Team Duemila has started cooperating with important companies of the tanning industry for the distribution of **Xtannery**. Since 2020 it has also signed an agreement with HUNI to distribute the product to foreign markets with DataTan 4.0 brand.

## The Advanced Solution for Tanning Industries

**Xtannery** management software for Windows, was designed to be easily customizable according to the specific needs of a tannery and adapted to the growing need for immediate information supply. The software is modular and can be used by any company, regardless of its size. Entrepreneurs can control business flows, identify critical issues more quickly and make timely decisions.

## Xtannery solves the modern tannery's biggest sales problems

### ACTIVE CYCLE

This module handles the most common problems in a modern tannery. It integrates with the **Production module**, allowing you to check the availability of leather through the different processing stages and to better estimate the delivery date. It receives data from the measuring machines and automatically prepares the **Packing list and transport documentation** for completed orders. It provides and receives information from the Accounting module for **customer reliability analysis**. The **CITES** module is also available.

### CONTRACT MANAGEMENT

This module handles the activities related to the **supply of leather** and allows you to plan the related financial activities, determining the total cost per unit. It is integrated with the **Administrative module** for accounting and invoice processing.

### PRODUCTION MANAGEMENT

This module handles all the production phases from the arrival of the leather to the finished product. Individual or batch orders can be loaded into the software and the production phases can be systematically monitored simply sorting and segmenting the data by different criteria, whether it's a specific stock or a customer as well as its current status. Products can also be sorted by Line/Family/Article/Color/Availability/Thickness.

### PASSIVE CYCLE

This module handles all issues related to the purchase of chemicals and accessories. The module oversees the **hides currently processed and what follows**, with triangulations and possible enhancements.

This module is integrated with the **Chemical Formulations module** to evaluate results and with the **Administrative module** for accounting and the processing of supplier invoices.

### WAREHOUSE MANAGEMENT

This module oversees the physical handling of materials. It values inventories according to different criteria and estimates the value of the hides currently undergoing production.

### QUALITY MANAGEMENT

For a complete Digital Transformation of a modern Tannery, **Xtannery** also provides a specific module for Quality, Environment and Safety management.

### COST ANALYSIS

This module acquires data directly from the other modules installed and helps with cost allocation as well as cost forecasting for each production stage.

### MANAGEMENT OF CHEMICAL FORMULATIONS

This module oversees the chemical products necessary for the various production formulations. The formulations can belong to different production stages (Tanning, Re-tanning, Dyeing, Finishing). It integrates with the purchasing module to determine the overall cost of formulations.

## Production advancement with RFID technology

In comparison to the classic barcode reading, the operators' activity is now simplified. The RFID technology is used to detect the progress of the tags and/or the production duration.

The operators simply have to place their RFID TAG and the CARD on the special reader and it automatically detects all the necessary information, then transfers it to **Xtannery**.

Interactive analysis and presentation of company data extracted from the management system

Interactive analysis of purchased stock and production, to ascertain costs and yield

Production efficiency assessments

Assessment of any imbalance or issue throughout the entire workflow

"Point & click" user interface

Direct export to MS Excel®

## XtanneryApp

The most complete and advanced management system for the tanning industry available on the market, now for tablets too.

- Check the order status (Bank Statements / Deadlines)
- Get a product catalogue with photos
- Manage price lists (including Color, Availability, Thickness and Size Variants)
- View the last price agreed with customer
- Sync stock in real-time
- Import customer orders
- Check order status with tags and learn the current production phase
- Check the status of customers' payments
- Use the tools available on tablets such as maps and emails to communicate with customers

XtanneryApp for IOS and Android
